

The brain sends (and could receive) signals to the several analog and digital interfaces. The signal could be:

- CV voltage (DV voltage, different ranges (-5..5V, -12..12V, other)
- Gate voltage signal (hi/lo, usually 0 or 5V)
- MIDI (classical or over USB)
- proprietary (e.g. for communication with Relay box)
- SPI (also proprietary or for standard parts, like screens)
- UTP (standard or audio over UTP protocols, e.g. MH)
